2. Discuss the easy and challenging parts of the assignment. How did you overcome all or some of the challenges?

Challenges:

- First five tasks of the assignment were easy but point 6 onwards I had started facing challenges.
- Main challenge was to dynamically group categories per category topic, and keep on adding new category names under respective topics dynamically. While doing so, the challenging task was to identify each added **topic uniquely** and add respective category names under it. I added this in connectDB file under getTopic() method which returned arrayList containing unique category topics.
- Next challenge was to route to the category selected and show it's information dynamically by taking reference of it's connection ID. Logic to append respective **connId** to url is added in Classes.ejs(Connections file), and on clicking the event ,it is being routed it to Class_Detail.ejs(connection detail) page. On Class_Detail.ejs file, logic to display the object details is written.
